Assignment-4: NumPy and its Applications

Learning objectives:

NumPy stands for Numerical Python. NumPy is a Python library used for working with arrays. It also has functions for working in domain of linear algebra, fourier transform, and matrices. NumPy is a general-purpose array-processing package. It provides a high-performance multidimensional array object and tools for working with these arrays. It is the fundamental package for scientific computing with Python.

Install Dependencies:

Before its application, ensure the following:

NumPy

```
pip install numpy
import numpy as np
```

OpenCV

```
pip install opencv-python
import cv2
img = cv2.imread('image.png', cv2.IMREAD_COLOR )
cv2.imshow('OUTPUT', img)
```

Matplot Library

```
pip install matplotlib
import matplotlib.pyplot as plt
```

Check time for execution

```
import time
seconds = time.time()
```

Once you install the requisite package, do the following tasks.

1. Write a program to load a .csv file as a NumPy 1-D array. Find the maximum and minimum elements in the array.
Hint: For the data, use the .csv file “Book1.csv”
2. For the Numpy 1-D array as obtained in Q.1, sort the elements in ascending order.
3. For the sorted Numpy 1-D array as obtained in Q.2, reverse the array and print.
4. Write a program to load three .csv files (Book1.csv, Book2.csv, and Book3.csv) as a list of Numpy 1-D arrays. Print the means of all arrays as a list.
5. Write a program to read an image, store the image in NumPy 2-D array. For the image consider a .PNG. Display the image. Let the array be X.
Hint: Use OpenCV to work with image.

6. Copy the data in X to another NumPy 2-D Array, say Y. Write a program to multiply two NumPy 2-D arrays, that is, $Z = X \times Y$.
7. **For all the problems 6, repeat without using NumPy and compare the computation times doing the same with NumPy.**
8. Write a program to convert a color image (say a.PNG) and display its grayscale version.
9. Plot the pixel intensity histogram using the grayscale image.
Hint: Use matplotlib to plot
10. Create a black rectangle at the position [(40,100) top right, (70, 200) bottom left] in the grayscale image.
11. For the grayscale image, display the binarized image with thresholds: [50, 70, 100, 150].
Hint: Binarizing is thresholding each pixel value, i.e., if $\text{pixel} > \text{threshold}$, then 1 else 0.
12. Consider the color image stored in a .png. Create a filter of $\begin{bmatrix} -1 & -1 & -1 \\ 0 & 0 & 0 \\ 1 & 1 & 1 \end{bmatrix}$, and multiply this filter to the image and output the resultant image.

[Book1.csv](#)

[Book2.csv](#)

[Book3.csv](#)

[a.png](#)

For Q. 1-4: 5 Marks each.

For Q. 5-12, 10 marks each.
